## Gute Laborpraxis/Good Laboratory Practice

### GLP-Bescheinigung/Statement of GLP Compliance (gemäß/according to § 19b Abs. 1 Chemikaliengesetz)

Eine GLP-Inspektion zur Überwachung der Einhaltung der GLP-Grundsätze gemäß Chemikaliengesetz bzw. Richtlinie 2004/9/EG wurde durchgeführt in

Assessment of conformity with GLP according to Chemikaliengesetz and Directive 2004/9/EEC at:

☒ Prüfeinrichtung/Test facility ☐ Prüfstandort/Test site

**Harlan Cytotest Cell Research GmbH**  
Harlan Cytotest Cell Research GmbH  
In den Leppsteinswiesen 19  
64380 Roßdorf

(Unverwechselbare Bezeichnung und Adresse/Unequivocal name and address)

#### Prüfungen nach Kategorien/Areas of Expertise (gemäß/according chemVwV-GLP Nr. 5.3/OECD guidance)

**2** Prüfungen zur Bestimmung der toxikologischen Eigenschaften  
**3** Prüfungen zur Bestimmung der erbgutverändernden Eigenschaften (in vitro und in vivo)  
**6** Prüfungen zur Bestimmung von Rückständen  
**8** Analytische Prüfungen an biologischen Materialien

**2** Toxicity studies  
**3** Mutagenicity studies  
**6** Residues  
**8** Analytical studies on biological materials

**15.08. und 27. – 29.10.2008**  
Datum der Inspektion/Date of Inspection  
(Tag Monat Jahr/day month year)

Die genannte Prüfeinrichtung befindet sich im nationalen GLP-Überwachungsverfahren und wird regelmäßig auf Einhaltung der GLP-Grundsätze überwacht.

The above mentioned test facility is included in the national GLP Compliance Programme and is inspected on a regular basis.

Auf der Grundlage des Inspektionsberichtes wird hiermit bestätigt, dass in dieser Prüfeinrichtung die oben genannten Prüfungen unter Einhaltung der GLP-Grundsätze durchgeführt werden können.

Based on the inspection report it can be confirmed, that this test facility is able to conduct the aforementioned studies in compliance with the Principles of GLP.

### 3.4 Project Staff Signature

Study Director

Dr. Hans-Eric Wollny

Date: February 26, 2013

### 3.5 Good Laboratory Practice

The study was performed in compliance with:

"Chemikaliengesetz" (Chemicals Act) of the Federal Republic of Germany, "Anhang 1" (Annex 1), in its currently valid version.

"OECD Principles of Good Laboratory Practice", as revised in 1997 [C(97)186/Final].

### 3.6 Guidelines

This study was conducted according to the procedures indicated by the following internationally accepted guidelines and recommendations:

Ninth Addendum to the OECD Guidelines for the Testing of Chemicals, February 1998, adopted July 21, 1997, Guideline No. 476 "*In vitro* Mammalian Cell Gene Mutation Test"

Commission Regulation (EC) No. 440/2008 B.17 "Mutagenicity – *In vitro* Mammalian Cell Gene Mutation Test", dated May 30, 2008.

### 3.7 Archiving

Harlan CCR will archive:

Raw data, study plan, report, and specimens (if any) for at least 3 years at the test facility's archive. Thereafter, the material will be transferred to the GLP archive of Harlan Laboratories Ltd. in Füllinsdorf, Switzerland for archiving the remaining time up to a total archiving period of 15 years. No data will be discarded without the sponsor's prior written consent.

A sample of the test item will be archived two years after the expiration date provided by the Sponsor. If no expiration date is given, the archiving period will be the required 15 years. Thereafter, the samples will be discarded without further notice.

### 3.8 Deviations to the study plan

There were no deviations to the study plan.

## 4 STATEMENT OF COMPLIANCE

Harlan CCR Study: 1502500

Test Item: Bis(2-ethylhexyl)tetrabromophthalate

Study Director: Dr. Hans-Eric Wollny

Title: Gene Mutation Assay  
in Chinese Hamster V79 Cells *in vitro* (V79/HPRT)  
with Bis(2-ethylhexyl)tetrabromophthalate

This study performed in the test facility of Harlan CCR was conducted in compliance with Good Laboratory Practice Regulations:

"Chemikaliengesetz" (Chemicals Act) of the Federal Republic of Germany, "Anhang 1" (Annex 1), in its currently valid version.

"OECD Principles of Good Laboratory Practice", as revised in 1997 [C(97)186/Final].

There were no circumstances that may have affected the quality or integrity of the study.

| Report:                                                                 | February 25, 2013 | February 25, 2013                                        |

This statement is to confirm that the present report reflects the raw data.

Head of Quality Assurance Unit      Frauke Hermann

Date: February 26, 2013

## 6 SUMMARY

The study was performed to investigate the potential of Bis(2-ethylhexyl)tetrabromophthalate to induce gene mutations at the HPRT locus in V79 cells of the Chinese hamster.

The assay was performed in two independent experiments, using two parallel cultures each. The first main experiment was performed with and without liver microsomal activation and a treatment period of 4 hours. The second experiment was performed with a treatment time of 4 hours with and 24 hours without metabolic activation.

The maximum test item concentration of 5800 µg/mL used in the pre-experiment with and without metabolic activation was equal to approximately 5000 µg/mL of the pure substance. The test item was dissolved in acetone. The dose range of the main experiments was limited by phase separation of the test item.

The tested concentrations are described in chapter 8.6 (page 14). The evaluated experimental points and the results are summarised in Table 1 (page 22).

No substantial and reproducible dose dependent increase of the mutation frequency was observed in both main experiments.

Appropriate reference mutagens, used as positive controls, induced a distinct increase in mutant colonies and thus, showed the sensitivity of the test system and the activity of the metabolic activation system.

### Conclusion

In conclusion it can be stated that under the experimental conditions reported the test item did not induce gene mutations at the HPRT locus in V79 cells.

Therefore, Bis(2-ethylhexyl)tetrabromophthalate is considered to be non-mutagenic in this HPRT assay.

## 7 OBJECTIVE

### 7.1 Aims of the Study

This *in vitro* assay was performed to assess the potential of the test item to induce gene mutations by means of two independent HPRT experiments using the Chinese hamster cell line V79. The treatment time was 4 hours in the first experiment with and without metabolic activation. In the second experiment the cells were exposed to the test item for 24 hours without metabolic activation and 4 hours with metabolic activation.

### 7.2 Relevance of the Test System

*In vitro* methods are valuable when it is desired to accurately control the concentration and exposure time of cells to the test item under study. However, the limited capacity of metabolic activation of potential mutagens requires an exogenous metabolic activation system.

This *in vitro* test is an assay for the detection of forward gene mutations in mammalian cells. Gene mutations are discussed as an initial step in the carcinogenic process.

The V79 cells are exposed to the test item both with and without exogenous metabolic activation. At a defined time interval after treatment the descendants of the treated original population are monitored for the loss of functional HPRT enzyme.

HPRT (hypoxanthine-guanine phosphoribosyl transferase) catalyzes the conversion of the nontoxic 6-TG (6-thioguanine) to its toxic ribophosphorylated derivative. Therefore, cells deficient in HPRT due to a forward mutation are resistant to 6-TG. These cells are able to proliferate in the presence of 6-TG whereas the non-mutated cells die. However, the mutant phenotype requires a certain period of time before it is completely expressed. The phenotypic expression is achieved by allowing exponential growth of the cells for 7 - 9 days. The expression period is terminated by adding 6-TG to the culture medium.

Mutant frequency is determined by seeding known numbers of cells in medium containing the selective agent to detect mutant cells, and in medium without selective agent to determine the surviving cells. After a suitable period the colonies are counted. Mutant frequencies are calculated from the number of mutant colonies corrected for cell survival.

In order to establish a concentration response effect of the test item at least four concentration levels are tested. These concentration levels should yield a concentration related toxic effect. The highest concentration level should induce a reduced level of survival.

To demonstrate the sensitivity of the test system reference mutagens are tested in parallel to the test item.

## 8 MATERIALS AND METHODS

### 8.1 Test Item

Internal Test Item Number: S1388311

The test item and the information concerning the test item were provided by the sponsor.

Identity: Bis(2-ethylhexyl)tetrabromophthalate  
Batch No.: 12128E71  
Purity: 90.6%; dose calculation adjusted to purity  
Molecular Weight: 706.1 g/mol  
Storage: At room temperature  
Expiration Date: May 09, 2015

#### Results of the analyses for stability of Bis(2-ethylhexyl)tetrabromophthalate:

| Nominal value<br>mg/mL | Theoretical value<br>mg/mL | Content of Test Item<br>mg/mL |                  |                   | Recovery as %<br>of theoretical value |                  |                   |
|------------------------|----------------------------|-------------------------------|------------------|-------------------|---------------------------------------|------------------|-------------------|
|                        |                            | Start                         | After<br>2 hours | After<br>24 hours | Start                                 | After<br>2 hours | After<br>24 hours |
| 0.05                   | 0.0506                     | 0.0520                        | 0.0524           | 0.0525            | 103                                   | 104              | 104               |
| 500                    | 547.9                      | 572.1                         | 577.2            | 585.7             | 104                                   | 105              | 107               |

The 0.05 mg/mL and 500 mg/mL formulations of the test item in acetone are homogeneous and stable at room temperature for at least 24 hours.

On the day of the experiment (immediately before treatment), the test item was dissolved in acetone (purity 99.9%). The final concentration of acetone in the culture medium was 0.5% (v/v).

The osmolarity and pH-value were determined in the solvent control and the maximum concentration of the pre-experiment without metabolic activation:

|                 | solvent control | Test Item<br>5800 µg/mL |
|-----------------|-----------------|-------------------------|
| Osmolarity mOsm | 368             | 329                     |
| pH-value        | 7.49            | 7.48                    |

## 8.2 Controls

### 8.2.1 Solvent Controls

Concurrent solvent controls (acetone) were performed.

|              |                                                                            |
|--------------|----------------------------------------------------------------------------|
| Name:        | Acetone                                                                    |
| Supplier:    | Merck, 64293 Darmstadt, Germany                                            |

The stability of both positive control substances in solution is unknown, but a mutagenic response in the expected mutation range is sufficient evidence of biological stability.

The dilutions of the stock solutions were prepared on the day of the experiment and used immediately.

## 8.3 Test System

### 8.3.1 Reasons for the Choice of the Cell Line V79

The V79 cell line has been used successfully in *in vitro* experiments for many years. Especially the high proliferation rate (doubling time 12 - 16 h in stock cultures) and a good cloning efficiency of untreated cells (as a rule more than 50%) both necessary for the appropriate performance of the study, recommend the use of this cell line. The cells have a stable karyotype with a modal chromosome number of 22 (3).

### 8.3.2 Cell Cultures

Large stocks of the V79 cell line (supplied by Laboratory for Mutagenicity Testing; Technical University, 64287 Darmstadt, Germany) are stored in liquid nitrogen in the cell bank of Harlan CCR allowing the repeated use of the same cell culture batch in experiments. Before freezing, the level of spontaneous mutants was depressed by treatment with HAT-medium as described in (4). Each batch is screened for mycoplasma contamination and checked for karyotype stability and spontaneous mutant frequency. Consequently, the parameters of the experiments remain similar because of the reproducible characteristics of the cells.

Thawed stock cultures are propagated at 37 °C in 80 cm<sup>2</sup> plastic flasks. About 5×10<sup>5</sup> cells were seeded into each flask with 15 mL of MEM (minimal essential medium) containing Hank's salts supplemented with 10% foetal bovine serum (FBS), neomycin (5 µg/mL) and amphotericin B (1%). The cells were sub-cultured twice weekly. The cell cultures were incubated at 37°C in a 1.5% carbon dioxide atmosphere (98.5% air).

## 8.4 Mammalian Microsomal Fraction S9 Mix

Lacking metabolic activities of cells under *in vitro* conditions are a disadvantage of assays with cell cultures as many chemicals only develop a mutagenic potential when they are metabolized by the mammalian organism. However, metabolic activation of chemicals can be achieved at least partially by supplementing the cell cultures with mammalian liver microsome preparations (S9 mix).

### 8.4.1 S9 (Preparation by Harlan CCR)

Phenobarbital/β-naphthoflavone induced rat liver S9 was used as the metabolic activation system. The S9 were prepared from 8 – 12 weeks old male Wistar rats (Hsd Cpb: WU, weight approx. 220 – 320 g, Harlan Laboratories B.V., 5960 AD Horst, The Netherlands) induced by intraperitoneal applications of 80 mg/kg b.w. phenobarbital (Desitin, 22335 Hamburg, Germany) and by peroral administrations of 80 mg/kg b.w. β-naphthoflavone (Sigma-Aldrich Chemie GmbH, 82024 Taufkirchen, Germany) each, on three consecutive days. The livers were prepared 24 hours after the last treatment. The S9 fractions were produced by dilution of the liver homogenate with a KCl solution (1+3 parts) followed by centrifugation at 9000 g. Aliquots of the supernatant were frozen and stored in ampoules at –80 °C. Small numbers of the ampoules were kept at –20 °C for up to one week. Each batch of S9 mix was routinely tested with 2-aminoanthracene as well as benzo(a)pyrene.

The protein concentration of the S9 preparation was 27.9 mg/mL (Lot. No.: 191012) in the pre-experiment and in the main experiments.

#### 8.4.2 S9 Mix

An appropriate quantity of S9 supernatant was thawed and mixed with S9 cofactor solution to result in a final protein concentration of 0.75 mg/mL in the cultures. Cofactors were added to the S9 supernatant to reach following concentrations in the S9 mix:

|       |                     |
|-------|---------------------|
| 8 mM  | MgCl <sub>2</sub>   |
| 33 mM | KCl                 |
| 5 mM  | glucose-6-phosphate |
| 4 mM  | NADP                |

in 100 mM sodium-phosphate-buffer, pH 7.4.

During the experiment, the S9 mix was stored in an ice bath. The S9 mix preparation was performed according to Ames et al.

### 8.5 Pre-Test on Toxicity

A pre-test was performed in order to determine the concentration range for the mutagenicity experiments. The general culture conditions and experimental conditions in this pre-test were the same as described for the mutagenicity experiment below. In this pre-test the colony forming ability of approximately 500 single cells (duplicate cultures per concentration level) after treatment with the test item was observed and compared to the controls. Toxicity of the test item is indicated by a reduction of the cloning efficiency (CE).

### 8.6 Dose Selection

According to the current OECD Guideline for Cell Gene Mutation Tests at least four analysable concentrations should be used in two parallel cultures. The pre-experiment was performed using eight concentrations. For freely-soluble and non-cytotoxic test items the maximum concentration should be 5 mg/mL, 5 µL/mL or 10 mM, whichever is the lowest. For cytotoxic test items the maximum concentration should result in approximately 10 to 20% relative survival or cell density at sub-cultivation and the analysed concentrations should cover a range from the maximum to little or no cytotoxicity. Relatively insoluble test items should be tested up to the highest concentration that can be formulated in an appropriate solvent as solution or homogenous suspension. These test items should be tested up or beyond their limit of solubility. Precipitation should be evaluated at the end of treatment by the unaided eye. Furthermore, test item induced changes in osmolarity are considered.

The highest test item concentration used in the pre-test was 5800 µg/mL equal to approximately 5000 µg/mL of the pure substance. The test item was dissolved in acetone. Test item concentrations between 45.3 µg/mL and 5800 µg/mL were used to evaluate toxicity in the presence (4 hours treatment) and absence (4 hours and 24 hours treatment) of metabolic activation. No relevant toxic effect occurred up to the maximum concentration with and without metabolic activation following 4 and 24 hours treatment.

The test medium was checked for precipitation or phase separation at the end of each treatment period (4 or 24 hours) prior to removal to the test item. Phase separation occurred at the lowest to the highest concentration at the end of 4 and 24 hours treatment with and without metabolic activation.

There was no relevant shift of pH and osmolality of the medium even at the maximum concentration of the test item.

Based on the results of the pre-experiment, the maximum concentration of the main experiments was selected. In both main experiments the individual concentrations were spaced by a factor of 3 to cover a range of soluble as well as insoluble concentrations.

Doses applied in the gene mutation assay with Bis(2-ethylhexyl)tetrabromophthalate (concentrations given in bold characters were chosen for the mutation rate analysis):

| exposure<br>period | S9<br>mix | concentrations<br>in µg/mL |     |      |                    |                     |                     |
|--------------------|-----------|----------------------------|-----|------|--------------------|---------------------|---------------------|
|                    |           | Experiment I               |     |      |                    |                     |                     |
| 4 hours            | -         | 3.0                        | 9.0 | 18.0 | 54.0 <sup>PS</sup> | 162.0 <sup>PS</sup> | 486.0 <sup>PS</sup> |
| 4 hours            | +         | 3.0                        | 9.0 | 18.0 | 54.0 <sup>PS</sup> | 162.0 <sup>PS</sup> | 486.0 <sup>PS</sup> |
|                    |           | Experiment II              |     |      |                    |                     |                     |
| 24 hours           | -         | 3.0                        | 9.0 | 18.0 | 54.0 <sup>PS</sup> | 162.0 <sup>PS</sup> | 486.0 <sup>PS</sup> |
| 4 hours            | +         | 3.0                        | 9.0 | 18.0 | 54.0 <sup>PS</sup> | 162.0 <sup>PS</sup> | 486.0 <sup>PS</sup> |

PS = Phase Separation

In experiment I and II the cultures at the maximum concentration with and without metabolic activation were not continued to avoid analysis of too many concentrations showing phase separation.

## 8.7 Experimental Performance

### 8.7.1 Culture Medium

For seeding and treatment of the cell cultures the complete culture medium was MEM (minimal essential medium) containing Hank's salts, neomycin (5 µg/mL) and amphotericin B (1%). For the selection of mutant cells the complete medium was supplemented with 11 µg/mL 6-thioguanine. All cultures were incubated at 37 °C in a humidified atmosphere with 1.5% CO<sub>2</sub> (98.5% air).

### 8.7.2 Seeding

Two to three days after sub-cultivation stock cultures were trypsinized at 37 °C for 5 minutes. Then the enzymatic digestion was stopped by adding complete culture medium with 10% FBS and a single cell suspension was prepared. The trypsin concentration for all sub-culturing steps was 0.2% in PBS.

The PBS is composed as follows (per litre):

|                                  |         |
|----------------------------------|---------|
| NaCl                             | 8000 mg |
| KCl                              | 200 mg  |
| KH <sub>2</sub> PO <sub>4</sub>  | 200 mg  |
| Na <sub>2</sub> HPO <sub>4</sub> | 150 mg  |

Prior to the trypsin treatment the cells were rinsed with Ca-Mg-free salt solution (PBS) containing 200 mg/l EDTA (ethylene diamine tetraacetic acid). Approximately  $1.5 \times 10^6$  (single culture) and  $5 \times 10^2$  cells (in duplicate) were seeded in plastic culture flasks. The cells were grown for 24 hours prior to treatment.

### 8.7.3 Treatment

After 24 hours the medium was replaced with serum-free medium containing the test item, either without S9 mix or with 50 µl/mL S9 mix. Concurrent solvent and positive controls were treated in parallel. After 4 hours this medium was replaced with complete medium following two washing steps with "saline G". In the second experiment the cells were exposed to the test item for 24 hours in complete medium, supplemented with 10% FBS, in the absence of metabolic activation.

The "saline G" solution had the following constituents (per litre):

|                                                      |         |
|------------------------------------------------------|---------|
| NaCl                                                 | 8000 mg |
| KCl                                                  | 400 mg  |
| Glucose                                              | 1100 mg |
| Na <sub>2</sub> HPO <sub>4</sub> × 2H <sub>2</sub> O | 192 mg  |
| KH <sub>2</sub> PO <sub>4</sub>                      | 150 mg  |

The pH was adjusted to 7.2

The colonies used to determine the cloning efficiency (survival) were fixed and stained approx. 7 days after treatment as described below.

Three or four days after treatment  $1.5 \times 10^6$  cells per experimental point were sub-cultivated in 175 cm<sup>2</sup> flasks containing 30 mL medium. Following the expression time of 7 days five 80 cm<sup>2</sup> cell culture flasks were seeded with about  $3 - 5 \times 10^5$  cells each in medium containing 6-TG. Two additional 25 cm<sup>2</sup> flasks were seeded with approx. 500 cells each in non-selective medium to determine the viability.

The cultures were incubated at 37 °C in a humidified atmosphere with 1.5% CO<sub>2</sub> for about 8 days. The colonies were stained with 10% methylene blue in 0.01% KOH solution.

The stained colonies with more than 50 cells were counted. In doubt the colony size was checked with a preparation microscope.

## 8.8 Data Recording

The data generated were recorded in the raw data. The results are presented in tabular form, including experimental groups with the test item, solvent, and positive controls.

## 8.9 Acceptability of the Assay

The gene mutation assay is considered acceptable if it meets the following criteria:

- the numbers of mutant colonies per  $10^6$  cells found in the solvent controls fall within the laboratory historical control data range (see Annex II).
- the positive control substances should produce a significant increase in mutant colony frequencies.
- the cloning efficiency II (absolute value) of the solvent controls must exceed 50%.

The data of this study comply with the above mentioned criteria [see Annex I (tables of results, mutation rate and factor calculated referring to the cloning efficiency of the untreated cultures) and Annex II (historical data)].

## 8.10 Evaluation of Results

A test item is classified as positive if it induces either a concentration-related increase of the mutant frequency or a reproducible and positive response at one of the test points.

A test item producing neither a concentration-related increase of the mutant frequency nor a reproducible positive response at any of the test points is considered non-mutagenic in this system.

A positive response is described as follows:

A test item is classified as mutagenic if it reproducibly induces a mutation frequency that is three times above the spontaneous mutation frequency at least at one of the concentrations in the experiment.

The test item is classified as mutagenic if there is a reproducible concentration-related increase of the mutation frequency. Such evaluation may be considered also in the case that a threefold increase of the mutant frequency is not observed.

However, in a case by case evaluation this decision depends on the level of the corresponding solvent control data. If there is by chance a low spontaneous mutation rate within the laboratory's historical control data range, a concentration-related increase of the mutations within this range has to be discussed. The variability of the mutation rates of solvent controls within all experiments of this study was also taken into consideration.

## 8.11 Statistical Analysis

A linear regression (least squares) was performed to assess a possible dose dependent increase of mutant frequencies. The number of mutant colonies obtained for the groups treated with the test item were compared to the solvent control groups. A trend is judged as significant whenever the p-value (probability value) is below 0.05. However, both, biological and statistical significance were considered together.

| experimental group                       | p-value |
|------------------------------------------|---------|
| experiment I, culture I without S9 mix   | 0.503   |
| experiment I, culture II without S9 mix  | 0.125   |
| experiment I, culture I with S9 mix      | 0.416   |
| experiment I, culture II with S9 mix     | 0.608   |
| experiment II, culture I without S9 mix  | 0.802   |
| experiment II, culture II without S9 mix | 0.168   |
| experiment II, culture I with S9 mix     | 0.389   |
| experiment II, culture II with S9 mix    | 0.416   |

## 9 CALCULATION AND PROCESSING OF THE DATA

The data listed in the tables (Annex I) are calculated and processed as described below.

### Pre-test

|                              |                                                                                                                                |
|------------------------------|--------------------------------------------------------------------------------------------------------------------------------|
| cloning efficiency, absolute | mean number of colonies per flask divided by the number of cells seeded $\times 100$                                           |
| cloning efficiency, relative | (mean number of colonies per flask divided by the mean number of colonies per flask of the corresponding control) $\times 100$ |

### Main test

|                                                        |                                                                                                                                  |
|--------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------|
| cloning efficiency I (survival)                        | cloning efficiency determined immediately after treatment to measure toxicity.                                                   |
| cloning efficiency II (viability)                      | cloning efficiency determined after the expression period to measure viability of the cells without selective agent.             |
| cloning efficiency I (survival, absolute)              | mean number of colonies per flask divided by the number of cells seeded                                                          |
| cloning efficiency I (survival, relative)              | (mean number of colonies per flask divided by the mean number of colonies per flask of the corresponding control) $\times 100$   |
| cell density % of control                              | (cell density at 1st subcultivation divided by the cell density at 1st subcultivation of the corresponding control) $\times 100$ |
| cloning efficiency II (viability, absolute)            | mean number of colonies per flask divided by the number of cells seeded                                                          |
| cloning efficiency II (viability, relative)            | cloning efficiency II absolute divided by the cloning efficiency II absolute of the corresponding control $\times 100$           |
| cells survived (after plating in TG containing medium) | number of cells seeded $\times$ cloning efficiency II absolute                                                                   |
| mutant colonies / $10^6$ cells                         | mean number of mutant colonies per flask found after plating in TG medium $\times 10^6$ divided by the number of cells survived  |
| induction factor                                       | mutant colonies per $10^6$ cells / mutant colonies per $10^6$ cells of the corresponding solvent control                         |

## 10 RESULTS AND DISCUSSION

The test item Bis(2-ethylhexyl)tetrabromophthalate was assessed for its potential to induce gene mutations at the HPRT locus using V79 cells of the Chinese hamster.

The study was performed in two independent experiments, using identical experimental procedures. In the first experiment the treatment period was 4 hours with and without metabolic activation. The second experiment was performed with a treatment time of 4 hours with and 24 hours without metabolic activation.

Doses applied in the gene mutation assay with Bis(2-ethylhexyl)tetrabromophthalate:

| exposure<br>period | S9<br>mix | concentrations<br>in µg/mL |     |      |                    |                     |
|--------------------|-----------|----------------------------|-----|------|--------------------|---------------------|
| Experiment I       |           |                            |     |      |                    |                     |
| 4 hours            | -         | 3.0                        | 9.0 | 18.0 | 54.0 <sup>PS</sup> | 162.0 <sup>PS</sup> |
| 4 hours            | +         | 3.0                        | 9.0 | 18.0 | 54.0 <sup>PS</sup> | 162.0 <sup>PS</sup> |
| Experiment II      |           |                            |     |      |                    |                     |
| 24 hours           | -         | 3.0                        | 9.0 | 18.0 | 54.0 <sup>PS</sup> | 162.0 <sup>PS</sup> |
| 4 hours            | +         | 3.0                        | 9.0 | 18.0 | 54.0 <sup>PS</sup> | 162.0 <sup>PS</sup> |

PS = Phase Separation

Phase separation of the test item at the end of treatment was noted at 54.0 µg/mL and above in experiment I and II in the presence and absence of metabolic activation.

No relevant toxic effects occurred up to the maximum evaluated concentration of 162.0 µg/mL.

No relevant and reproducible increase in mutant colony numbers/10<sup>6</sup> cells was observed in the main experiments up to the maximum concentration with and without metabolic activation. The mutation frequency did not exceed the range of solvent controls.

A linear regression analysis (least squares) was performed to assess a possible dose dependent increase of mutant frequencies. No significant dose dependent trend of the mutation frequency indicated by a probability value of <0.05 was determined in any of the experimental groups.

In both experiments of this study (with and without S9 mix) the range of the solvent controls was from 10.0 up to 23.4 mutants per 10<sup>6</sup> cells; the range of the groups treated with the test item was from 5.5 up to 26.7 mutants per 10<sup>6</sup> cells.

EMS (150 µg/mL) and DMBA (1.1 µg/mL) were used as positive controls and showed a distinct increase in induced mutant colonies.

### Conclusion

In conclusion it can be stated that under the experimental conditions reported the test item did not induce gene mutations at the HPRT locus in V79 cells.

Therefore, Bis(2-ethylhexyl)tetrabromophthalate is considered to be non-mutagenic in this HPRT assay.

---
